Question 1

Question Type: MultipleChoice

In the cloud motif, the data owner is usually:

Options:

A- The cloud provider
B- In another jurisdiction
C- The cloud customer
D- The cloud access security broker

Answer:

C

Explanation:

The data owner is usually considered the cloud customer in a cloud configuration; the data in question is the customer's information, being processed in the cloud. The cloud provider is only leasing services and hardware to the customer. The cloud access security broker (CASB) only handles access control on behalf of the cloud customer, and is not in direct contact with the production data.

Question 2

Question Type: MultipleChoice

Countermeasures for protecting cloud operations against external attackers include all of the following except:

Options:

A- Continual monitoring for anomalous activity.
B- Detailed and extensive background checks.
C- Regular and detailed configuration/change management activities
D- Hardened devices and systems, including servers, hosts, hypervisors, and virtual machines.

Answer:

B

Explanation:

Background checks are controls for attenuating potential threats from internal actors; external threats aren't likely to submit to background checks.

Question 3

Question Type: MultipleChoice

Which of the following are attributes of cloud computing?

Options:

A- Minimal management effort and shared resources
B- High cost and unique resources
C- Rapid provisioning and slow release of resources
D- Limited access and service provider interaction

Answer:

A

Explanation:

Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.

Question 4

Question Type: MultipleChoice

What is the intellectual property protection for a useful manufacturing innovation?

Options:

A- Trademark
B- Copyright
C- patent
D- Trade secret

Answer:

C

Explanation:

Patents protect processes (as well as inventions, new plantlife, and decorative patterns). The other answers listed are answers to other questions.

Question 5

Question Type: MultipleChoice

Because of multitenancy, specific risks in the public cloud that don't exist in the other cloud service models include all the following except:

Options:

A- DoS/DDoS
B- Information bleed
C- Risk of loss/disclosure due to legal seizures
D- Escalation of privilege

Answer:

A

Explanation:

DoS/DDoS threats and risks are not unique to the public cloud model.

Question 6

Question Type: MultipleChoice

Which of the following areas of responsibility always falls completely under the purview of the cloud provider, regardless of which cloud service category is used?

Options:

A- Infrastructure
B- Data
C- Physical
D- Governance

P2P exams

Answer:

C

Explanation:

Regardless of the cloud service category used, the physical environment is always the sole responsibility of the cloud provider. In many instances, the cloud provider will supply audit reports or some general information about their physical security practices, especially to those customers or potential customers that may have regulatory requirements, but otherwise the cloud customer will have very little insight into the physical environment. With IaaS, the infrastructure is a shared responsibility between the cloud provider and cloud customer. With all cloud service categories, the data and governance are always the sole responsibility of the cloud customer.

P2P exams

Question 7

Question Type: MultipleChoice

Limits for resource utilization can be set at different levels within a cloud environment to ensure that no particular entity can consume a level of resources that impacts other cloud customers.

Which of the following is NOT a unit covered by limits?

Options:

A- Hypervisor
B- Cloud customer
C- Virtual machine
D- Service

Answer:

A

Explanation:

The hypervisor level, as a backend cloud infrastructure component, is not a unit where limits may be applied to control resource utilization. Limits can be placed at the service, virtual machine, and cloud customer levels within a cloud environment.

Question 8

Question Type: MultipleChoice

In attempting to provide a layered defense, the security practitioner should convince senior management to include security controls of which type?

Options:

A- Physical
B- All of the above
C- technological
D- Administrative

Answer:

B

Explanation:

Layered defense calls for a diverse approach to security.
