Question 1

Question Type: MultipleChoice

When using the Alibaba Cloud CLI, what is the default data format for responses, when executing queries such as "aliyun ecs DescribeInstances"?

Options:

A- JSON
B- YAML
C- XML
D- TABLE

Answer:

A

Question 2

Question Type: MultipleChoice

A developer recently discovered that their company's application is beginning to suffer performance degradation as a result of increased user demand for the application. After some analysis, the major bottleneck is discovered to be the RDS database instance which hosts the company's databases, "A" and "B". The developer plans to use the DTS data migration solution to move one of the databases to a new RDS instance. Which of the following statements is correct? (Number of correct answers: 3)

Options:

A- The code for the application will have to be rewritten once this migration is complete.
B- The database account used for data migration must have read and write permissions. To ensure database security, please delete the database account used for data migration or reclaim related write permissions after data migration is completed.
C- After disconnecting the connection between the source instance database B and the application, you need to log in to the source database B to check the session messages to ensure that no new sessions performed write operations.
D- Create a reverse data migration task and start it to migrate subsequent incremental data from target Instance database B to source instance database B.

Answer:

A, B, C

Question 3

Question Type: MultipleChoice

Which data format is NOT supported by Alibaba Cloud Message Service?

Options:

A- XML
B- JSON
C- SIMPLIFIED
D- VERBOSE

Answer:

D

Question 4

Question Type: MultipleChoice

Assume that a company uses ApsaraDB for PolarDB. The company commonly queries users based on their basic information, including: addresses, company names, and ID numbers. In this scenario, what is the best practice for creating a database index (or indexes)?

Options:

A- Create a b-tree index on each column to be searched.
B- Create a hash index on each column to be searched.
