Question 1

Question Type: MultipleChoice

Which option best is the BEST type of fire extinguisher for a data center environment?

Options:

- A- Class A
- B- Class B
- C- Class C
- D- Class D

Answer:

C

Question 2

Question Type: MultipleChoice

An organization is migrating some of its applications to the cloud. The Chief Information Security Officer (CISO) is concerned about the accuracy of the reports showing which application should be migrated and how many applications reside on each server. As a result, the CISO is looking to establish asset management requirements. Which of these elements should be considered part of asset management requirements?

Options:

- A- Threat modelling and discovery
- B- Configuration Management (CM) database
- C- Risk management framework
- D- Integration testing program

Answer:

B

Question 3

Question Type: MultipleChoice

Which of the following is the fundamental difference between finite loading and other capacity planning approaches?

Options:

- A- It is highly dependent on advanced computer software to function effectively.
- B- It is only managed by shop floor supervisors.
- C- It can use historical information to drive decision-making processes.
- D- It considers adjustments to plans based on planned capacity utilization.

Answer:

D

Explanation:

Finite loading is a capacity planning approach that takes into account the available capacity of the resources and does not allow overloading. It considers adjustments to plans based on planned capacity utilization, which means that it can change the start or end dates of the operations to avoid exceeding the capacity limits. This way, finite loading ensures that the production schedule is realistic and feasible. Other capacity planning approaches, such as infinite loading, do not consider adjustments to plans based on planned capacity utilization. Infinite loading ignores the capacity constraints and schedules the operations based on the due dates and the lead times, regardless of the resource availability. This may result in overloading the resources and causing delays or disruptions in the production process. Therefore, the fundamental difference between finite loading and other capacity planning approaches is that finite loading considers adjustments to plans based on planned capacity utilization, while other approaches do not. FINITE LOADING

Question 4

Question Type: MultipleChoice

One advantage of adopting a supply network perspective is that it:

Options:

- A- protects global markets.
- B- enhances understanding of competitive and cooperative forces.
- C- defines the market relationships and partnerships.
- D- encourages rivals to collaborate.

Answer:

B

Explanation:

One advantage of adopting a supply network perspective is that it enhances understanding of competitive and cooperative forces. A supply network perspective is a holistic view of the supply chain that considers the interdependencies and interactions among the various entities involved in the flow of materials, information, and money. A supply network perspective helps to identify the sources of value creation and capture, the opportunities and threats in the market, and the potential synergies and conflicts among the supply chain partners. A supply network perspective also helps to design and implement effective strategies and tactics to achieve competitive advantage and customer satisfaction. The other statements are not advantages of adopting a supply network perspective. Protecting global markets, defining market relationships and partnerships, and encouraging rivals to collaborate are possible outcomes or objectives of adopting a supply network perspective, but they are not the benefits of the perspective itself. Question 5

Question Type: MultipleChoice

A company's Marketing and Sales departments have identified an opportunity to develop a new market for a product family and requested an increase in the production plan. Which of the following actions would be most appropriate to account for the new market opportunity?

Options:

- A- Increase the production plan as requested.
- B- Regenerate the material requirements plan.
- C- Regenerate the master production schedule (MPS).
- D- Present the proposal at the executive sales and operations (S&OP) meeting.

Answer:

D

Explanation:

Sales and Operations Planning (S&OP) is the proper forum for evaluating cross-functional impacts of a change in demand, including capacity, supply, and financial implications. Executive-level S&OP meetings align demand and supply decisions and ensure that changes in strategic direction are reviewed and approved.

Question 6

Question Type: MultipleChoice

When developing information security policies, What is the PRIMARY concern?

Options:

- A- Alignment with business requirements
- B- Compliance with legal requirements
- C- Alignment with regulatory requirements
- D- Compliance with international standards

Answer:

A

Question 7

Question Type: MultipleChoice

During an onsite audit, an assessor inspected an organization's asset decommission practice. Which of the following would MOST likely be a finding from a security point of view?

Options:

- A- Solid State Drives (SSD) were degaussed along with hard drives.
- B- The Non-Disclosure Agreement (NDA) between the organization and its data disposal service was more than 3 years old.
- C- Hard drives from older assets replaced defective hard drives from current assets of similar classification levels.
- D- Data classifications were not clearly identified.

Answer:

A

Question 8

Question Type: MultipleChoice

An organization's system engineer arranged a meeting with the system owner and a few major stakeholders to finalize the feasibility analysis for a new application.

Which of the following topics will MOST likely be on the agenda?

Options:

- A- Results of the preliminary cost-benefit studies
- B- Design of the application system and database processes
- C- Communication of procedures and reporting requirements
- D- Identification of inter-application dependencies

Answer:

A
