Question 1

Question Type: MultipleChoice

The word FALSE is a valid Filter transformation condition?

Options:

A- True

B- False

Answer:

B

Question 2

Question Type: MultipleChoice

How does a single joiner transformation join data?

Options:

A- From 2 pipeline inputs

B- From 3 pipeline inputs

C- From n number of pipeline inputs assuming you have purchased the N-Joiner Option

D- When transformation scope is set to a value of transaction, the sorter will sort on every record in the pipeline before it releases any data. The intermediate sort file will have markers for each transaction.

Answer:

A

Question 3

Question Type: MultipleChoice

The user creates a mapping by using aggregator transformation. The aggregator transformation receives sorted input from sorted transformation. What is the default partition type for

aggregator transformation?

Options:

- A- Pass-through
- B- Hash auto-keys
- C- Not a valid partition points
- D- Based on the transformation scope

Answer:

B

Question 5

Question Type: MultipleChoice

When using the Joiner transformation and assuming that you are not employing the Push Down Optimization feature, which statement is correct?

Options:

- A- The data from the detail pipeline is used to build the cache files used in the join process
- B- The data from the master pipeline is used to build the cache files used in the join process
- C- The cache files are built according to a sql override found on the Joiner Properties tab
- D- The Joiner transformation uses the database to build the join result

Answer:

B

Question 6

Question Type: MultipleChoice

Please Select one of the following. In a static, non-multi-row lookup,

Options:

- A- If a lookup search does not find a value in the search data, then the row from which the search is produced is dropped so a balanced pipeline can be produced
- B- If a lookup search finds the search value in the lookup data but discovers that the fields that are being returned from the search are null, then the row from which the search is produced is dropped so that a balanced pipeline can be produced
- C- If the lookup finds two records that match the search key, it will return two records
- D- Dynamic caching cannot be enabled on a lookup that returns multiple rows per search

Answer:

D
