Question 1

Question Type: MultipleChoice

In order to join a file server to the Active Directory domain `intra.example.com`, the following `smb.conf` has been created:

```
[global]
    workgroup = intra.example.com
    netbios name = Fileserver
    server role = member server
    idmap config * : backend = tdb
    idmap config * : range = 10000-199999
    winbind enum users = yes
    winbind enum group = yes
```

The command `net ads join` raises an error and the server is not joined to the domain. What should be done to successfully join the domain?

Options:

- A-** Change server role to `ad member server` to join an Active Directory domain instead of an NT4 domain.
- B-** Add `realm = intra.example.com` to the `smb.conf` and change `workgroup` to the domain's netbios workgroup name.
- C-** Manually create a machine account in the Active Directory domain and specify the machine account's name with `--U` when starting

net ads join.

D- Remove the winbind enum users and winbind enum groups since winbind is incompatible with Active Directory domains.

E- Remove all idmap configuration stanzas since the id mapping is defined globally in an Active Directory domain and cannot be changed on a member server.
