Question 1

Question Type: MultipleChoice

Task 12

You need to create a Group Policy Object (GPO) named GPO1 that only applies to a group named MemberServers.

Options:

A- See the solution of this Task below

Answer:

A

Explanation:

To create a GPO named GPO1 that only applies to a group named MemberServers, you can follow these steps:

On a domain controller or a computer that has the Remote Server Administration Tools (RSAT) installed, open Group Policy Management from the Administrative Tools menu or by typing `gpmmc.msc` in the Run box.

In the left pane, expand your domain and right-click on Group Policy Objects. Select New to create a new GPO.

In the New GPO dialog box, enter GPO1 as the Name of the new GPO and click OK. You can also optionally select a source GPO to copy the settings from.

Right-click on the new GPO and select Edit to open the Group Policy Management Editor. Here, you can configure the settings that you want to apply to the group under the Computer Configuration and User Configuration nodes. For more information on how to edit a GPO, see [Edit a Group Policy Object](#).

Close the Group Policy Management Editor and return to the Group Policy Management console. Right-click on the new GPO and select Scope. Here, you can specify the scope of management for the GPO, such as the links, security filtering, and WMI filtering.

Under the Security Filtering section, click on Authenticated Users and then click on Remove. This will remove the default permission granted to all authenticated users and computers to apply the GPO.

Click on Add and then type the name of the group that you want to apply the GPO to, such as Member Servers. Click OK to add the group to the security filter. You can also click on Advanced to browse the list of groups available in the domain.

Optionally, you can also configure the WMI Filtering section to further filter the GPO based on the Windows Management Instrumentation (WMI) queries. For more information on how to use WMI filtering, see [Filter the scope of a GPO by using WMI filters](#).

To link the GPO to an organizational unit (OU) or a domain, right-click on the OU or the domain in the left pane and select Link an Existing GPO. Select the GPO that you created, such as GPO1, and click OK. You can also change the order of preference by using the Move Up and Move Down buttons.

Wait for the changes to replicate to other domain controllers. You can also force the update of the GPO by using the `gpupdate /force` command on the domain controller or the client computers. For more information on how to update a GPO, see [Update a Group](#)

Policy Object.

Now, you have created a GPO named GPO1 that only applies to a group named MemberServers. You can verify the GPO application by using the `gpresult /r` command on a member server and checking the Applied Group Policy Objects entry. You can also use the Group Policy Results wizard in the Group Policy Management console to generate a report of the GPO application for a specific computer or user. For more information on how to use the Group Policy Results wizard, see [Use the Group Policy Results Wizard](#).

Question 2

Question Type: MultipleChoice

Task 11

You need to ensure that all DHCP clients that get an IP address from SRV1 will be configured to use DC1 as a DNS server.

Options:

A- See the solution of this Task below

Answer:

A

Explanation:

One possible solution to ensure that all DHCP clients that get an IP address from SRV1 will be configured to use DC1 as a DNS server is to use the DHCP scope options. DHCP scope options are settings that apply to all DHCP clients that obtain an IP address from a specific scope. You can use the DHCP scope options to specify the DNS server IP address, as well as other parameters such as the default gateway, the domain name, and the DNS suffix. Here are the steps to configure the DHCP scope options on SRV1:

On SRV1, open DNS Manager from the Administrative Tools menu or by typing `dnsmgmt.msc` in the Run box.

In the left pane, expand your DHCP server and click on IPv4.

In the right pane, right-click on the scope that you want to configure and select `Properties`.

In the `Scope Properties` dialog box, click on the `DNS` tab.

Check the box `Enable DNS dynamic updates according to the settings below`. This option allows the DHCP server to register and update the DNS records for the DHCP clients.

Select the option `Always dynamically update DNS records`. This option ensures that the DHCP server updates both the A and PTR records for the DHCP clients, regardless of whether they request or support dynamic updates.

Check the box `Discard A and PTR records when lease is deleted`. This option allows the DHCP server to delete the DNS records for the DHCP clients when their leases expire or are released.

Check the box `Dynamically update DNS records for DHCP clients that do not request updates`. This option allows the DHCP server to update the DNS records for the DHCP clients that do not support dynamic updates, such as legacy or non-Windows clients.

In the `DNS servers` section, click on the `Add` button to add a new DNS server IP address.

In the `Add Server` dialog box, enter the IP address of DC1, which is the DNS server that you want to use for the DHCP clients, and click `Add`.

Click `OK` to close the `Add Server` dialog box and return to the `Scope Properties` dialog box.

Click `OK` to apply the changes and close the `Scope Properties` dialog box.

Now, all DHCP clients that get an IP address from SRV1 will be configured to use DC1 as a DNS server. You can verify the DNS configuration by using the `ipconfig /all` command on a DHCP client computer and checking the `DNS Servers` entry. You can also check the DNS records for the DHCP clients by using the `DNS Manager` console on DC1.

Question 3

Question Type: MultipleChoice

Task 10

You need to configure Hyper-V to ensure that running virtual machines can be moved between SRV1 and SRV2 without downtime.

You do NOT need to move any virtual machines at this time.

Options:

A- See the solution of this Task below

Answer:

A

Explanation:

One possible solution to configure Hyper-V to ensure that running virtual machines can be moved between SRV1 and SRV2 without downtime is to use Live Migration. Live Migration is a feature of Hyper-V that allows you to move a running virtual machine from one host to another without any noticeable interruption of service. To set up Live Migration between SRV1 and SRV2, you need to perform the following steps:

On both SRV1 and SRV2, open Hyper-V Manager from the Administrative Tools menu or by typing `virtmgmt.msc` in the Run box.

In the left pane, right-click on the name of the server and select `Hyper-V Settings`.

In the `Hyper-V Settings` dialog box, select `Live Migrations` in the navigation pane.

Check the box `Enable incoming and outgoing live migrations`.

Under **Authentication** protocol, select the method that you want to use to authenticate the live migration traffic between the servers. You can choose either **Kerberos** or **CredSSP**. Kerberos does not require you to sign in to the source server before starting a live migration, but it requires you to configure constrained delegation on the domain controller. CredSSP does not require you to configure constrained delegation, but it requires you to sign in to the source server through a local console session, a Remote Desktop session, or a remote Windows PowerShell session. For more information on how to configure constrained delegation, see [Configure constrained delegation](#).

Under **Performance** options, select the option that best suits your network configuration and performance requirements. You can choose either **TCP/IP** or **Compression** or **SMB**. TCP/IP uses a single TCP connection for the live migration traffic. Compression uses multiple TCP connections and compresses the live migration traffic to reduce the migration time and network bandwidth usage. SMB uses the Server Message Block (SMB) 3.0 protocol and can leverage SMB features such as SMB Multichannel and SMB Direct. For more information on how to choose the best performance option, see [Choose a live migration performance option](#).

Under **Advanced Features**, you can optionally enable the **Use any available network for live migration** option, which allows Hyper-V to use any available network adapter on the source and destination servers for live migration. If you do not enable this option, you need to specify one or more network adapters to be used for live migration by clicking on the **Add** button and selecting the network adapter from the list. You can also change the order of preference by using the **Move Up** and **Move Down** buttons.

Click **OK** to apply the settings.

Now, you have configured Hyper-V to enable live migration between SRV1 and SRV2. You can use Hyper-V Manager or Windows PowerShell to initiate a live migration of a running virtual machine from one server to another.

Question 4

Question Type: MultipleChoice

Task 9

You plan to create group managed service accounts (gMSAs).

You need to configure the domain to support the creation of gMSAs.

Options:

A- See the solution of this Task below

Answer:

A

Explanation:

To configure the domain to support the creation of gMSAs, you need to perform the following steps:

On a domain controller or a computer that has the Remote Server Administration Tools (RSAT) installed, open PowerShell as an administrator and run the following command to install the Active Directory module:

```
Install-WindowsFeature -Name RSAT-AD-PowerShell
```

Run the following command to create a Key Distribution Service (KDS) root key, which is required for generating passwords for gMSAs. You only need to do this once per domain:

```
Add-KdsRootKey -EffectiveImmediately
```

Wait for at least 10 hours for the KDS root key to replicate to all domain controllers in the domain. Alternatively, you can use the `EffectiveTime` parameter to specify a past date and time for the KDS root key, but this is not recommended for security reasons. For more information, see `Add-KdsRootKey`.

After the KDS root key is replicated, you can create and configure gMSAs using the `New-ADServiceAccount` and `Set-ADServiceAccount` cmdlets. For more information, see `Create a gMSA` and `Configure a gMSA`.

Question 5

Question Type: MultipleChoice

Task 8

You need to create an Active Directory Domain Services (AD DS) site named Site2 that is associated to an IP address range of 192.168.2.0 to 192.168.2.255.

Options:

A- See the solution of this Task below

Answer:

A

Explanation:

To create an AD DS site named Site2 that is associated to an IP address range of 192.168.2.0 to 192.168.2.255, you can follow these steps:

On a domain controller or a computer that has the Remote Server Administration Tools (RSAT) installed, open Active Directory Sites and Services from the Administrative Tools menu or by typing `dssite.msc` in the Run box.

In the left pane, right-click on Sites and select New Site.

In the New Object - Site dialog box, enter Site2 as the Name of the new site. Select a site link to associate the new site with, such as DEFAULTIPSITELINK, and click OK. You can also create a new site link if you want to customize the replication frequency and schedule between the sites. For more information on how to create a site link, see [Create a Site Link](#).

In the left pane, right-click on Subnets and select New Subnet.

In the New Object - Subnet dialog box, enter 192.168.2.0/24 as the Prefix of the subnet. This notation represents the IP address range of 192.168.2.0 to 192.168.2.255 with a subnet mask of 255.255.255.0. Select Site2 as the Site object to associate the subnet with, and

clickOK.

Wait for the changes to replicate to other domain controllers. You can verify the site and subnet creation by checking theSitesandSubnetscontainers in Active Directory Sites and Services.

Now, you have created an AD DS site named Site2 that is associated to an IP address range of 192.168.2.0 to 192.168.2.255. You can add domain controllers to the new site and configure the site links and site link bridges to optimize the replication topology.

Question 6

Question Type: MultipleChoice

Task 7

You need to monitor the security configuration of DC1 by using Microsoft Defender for Cloud.

The required source files are located in a folder named `\\dc1.contoso.com\install`.

Options:

A- See the solution of this Task below

Answer:

A

Explanation:

One possible solution to monitor the security configuration of DC1 by using Microsoft Defender for Cloud is to use the Guest Configuration feature. Guest Configuration is a service that audits settings inside Linux and Windows virtual machines (VMs) to assess their compliance with your organization's security policies. You can use Guest Configuration to monitor the security baseline settings for Windows Server in the Microsoft Defender for Cloud portal by following these steps:

On DC1, open a web browser and go to the folder named `\dc1.contoso.com\install`. Download the Guest Configuration extension file (GuestConfiguration.msi) and save it to a local folder, such as `C:\Temp`.

[Run the Guest Configuration extension file and follow the installation wizard. You can choose to install the extension for all users or only for the current user. For more information on how to install the Guest Configuration extension, see \[Install the Guest Configuration extension\]\(#\).](#)

After the installation is complete, sign in to the Microsoft Defender for Cloud portal (2).

In the left pane, select **Security Center** and then **Recommendations**.

In the recommendations list, find and select **Vulnerabilities in security configuration on your Windows machines should be remediated** (powered by Guest Configuration).

[In the **Remediate Security Configurations** page, you can see the compliance status of your Windows VMs, including DC1, based on the **Azure Compute Benchmark**. The Azure Compute Benchmark is a set of rules that define the desired configuration state of your VMs.](#)

You can also see the number of failed, passed, and skipped rules for each VM. For more information on the Azure Compute Benchmark, see [Microsoft cloud security benchmark: Azure compute benchmark is now available](#).

To view the details of the security configuration of DC1, click on the VM name and then select **View details**. You can see the list of rules that apply to DC1 and their compliance status. You can also see the severity, description, and remediation steps for each rule. For example, you can see if DC1 has the latest security updates installed, if the firewall is enabled, if the password policy is enforced, and so on.

To monitor the security configuration of DC1 over time, you can use the **Compliance over time** chart, which shows the trend of compliance status for DC1 in the past 30 days. You can also use the **Compliance breakdown** chart, which shows the distribution of compliance status for DC1 by rule severity.

By using Guest Configuration, you can monitor the security configuration of DC1 by using Microsoft Defender for Cloud and ensure that it meets your organization's security standards. You can also use Guest Configuration to monitor the security configuration of other Windows and Linux VMs in your Azure environment.
