## Question 1

---

**Question Type: MultipleChoice**

---

A customer has two workflows. One workflow can use either SMB 3.0 or ISCSI. The other only leverage NFS.

What should the architect recommend as a strategy?

### Options:

---

- A- Use FlashBlade for both environments
- B- Use block storage for both environments
- C- Use block storage for NFS and FlashBlade for ISCSI
- D- Use block storage for ISCSI and FlashBlade for NFS. \*\*\*

### Answer:

---

D

## Question 2

---

**Question Type: MultipleChoice**

---

A company has a datacenter with a lot of electromagnetic interference. Their switches are 9m away from the FlashBlade and do NOT support speed faster than 10Gb/s.

Which cable should the architect use?

**Options:**

---

- A- Shielded ethernet cable. \*\*\*
- B- Passive Twinax cable.
- C- Fiber optic cable.
- D- Active Twinax cable.

**Answer:**

---

A

## Question 3

---

**Question Type: MultipleChoice**

---

A customer has a 7x52TB system and reports poor workload performance.

The customer provides the following information:

1. The customer has 4 host connecting using NFS.
2. The environment is running VMware with 300 VMs.
3. The FlashBlade is connected to the customer network using 4x40Gb/s links

What is causing this issue?

**Options:**

---

- A-** The environment does NOT have enough concurrency to the FlashBlade.
- B-** The environment does NOT have properly configured jumbo frames.
- C-** The customer must buy more blade to improve performance. \*\*\*
- D-** The customer must configure and optimal I/O size for the file system.

**Answer:**

---

C

## Question 4

---

**Question Type: MultipleChoice**

---

Which two network configurations must be present for FlashBlade to server data? (Select two.)

**Options:**

---

- A- Duplex set to Auto
- B- LAG(s) \*\*\*
- C- Active/active port-channel \*\*\*
- D- A reachable SMTP server
- E- A reachable SNMP server

**Answer:**

---

B, C

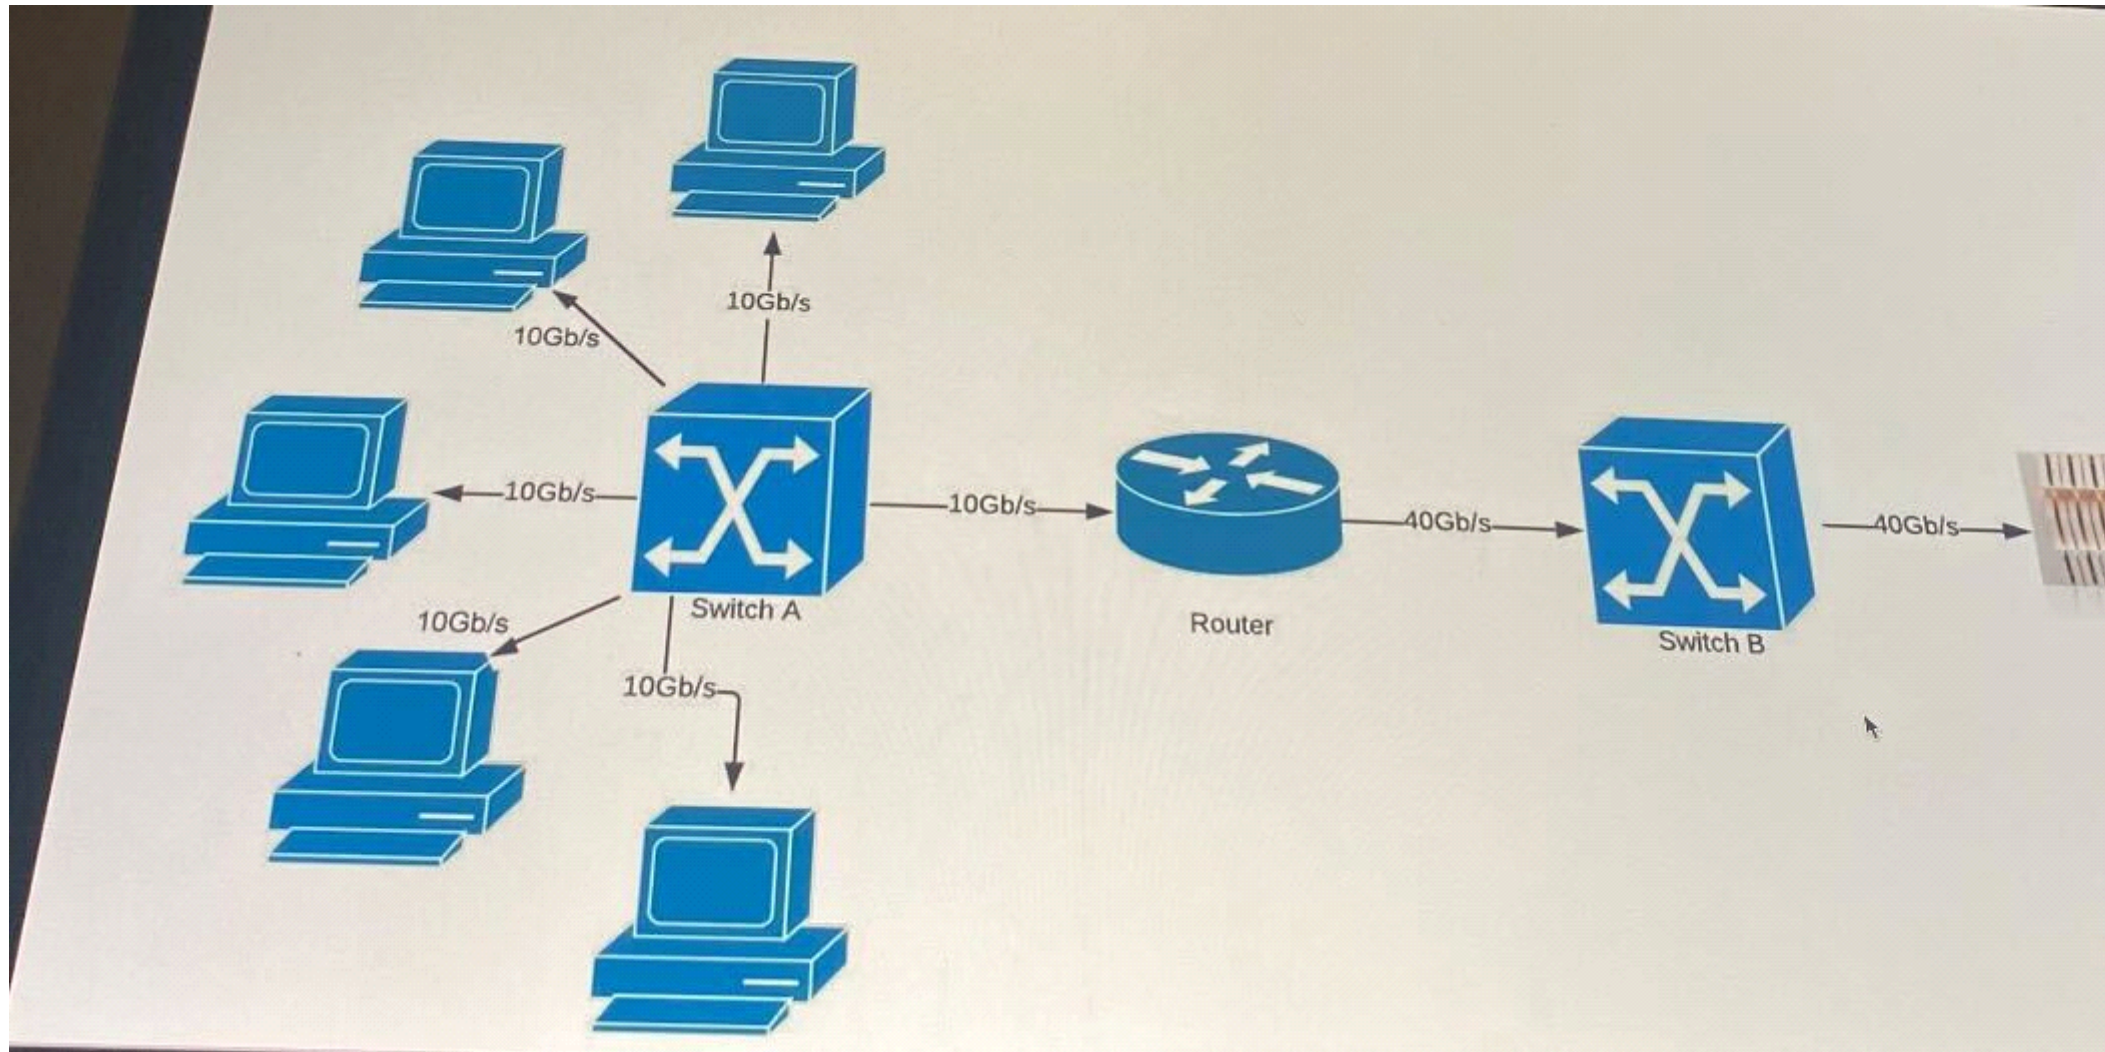

## Question 5

---

**Question Type: MultipleChoice**

---

Refer to the exhibit.

The customer reports that the end clients shown in the diagram are NOT completing jobs on time. Each client writes 300MB/s to the FlashBlade for 45 minutes every hour, and they run concurrently. What does the architect need to do?

**Options:**

---

- A- Increase the number of DataVIPs available to the clients.
- B- Add additional mount point on each client.
- C- Increase bandwidth between Switch A and the Router.
- D- Stagger the job start times between the clients. \*\*\*

**Answer:**

---

D

## Question 6

---

**Question Type: MultipleChoice**

---

A customer practices agile development, and they are having performance issues with builds of the most actively developed software suite as they attempt additional concurrent builds. What is causing the issue?

**Options:**

---

- A- Locking of shared library files during compilations.

- B-** Latency between the compilation server and the legacy storage. \*\*\*
- C-** Jumbo frames are NOT configured correctly.
- D-** Legacy storage does NOT have enough uplinks.

**Answer:**

---

B

## Question 7

---

**Question Type:** MultipleChoice

---

What is the support speed of the out-of-bound management port?

**Options:**

---

- A-** 100Mb/s
- B-** 10Gb/s
- C-** 1Gb/s \*\*\*
- D-** 10Mb/s

**Answer:**

---

C

## Question 8

---

**Question Type:** MultipleChoice

---

A architect is reading a customer's network diagram and notices that they are using a SAS-based NAS for a 12TB physical database server.

What does this assume about the customer?

**Options:**

---

- A-** They are cost sensitive.
- B-** They are latency sensitive
- C-** They are NOT concerned with database performance. \*\*\*
- D-** They prefer storage with built-in data reduction.

**Answer:**

---

## Question 9

---

**Question Type:** MultipleChoice

---

A customer map application is built with a containerized micro-service infrastructure that runs on Windows and accesses storage using SMB.

Each container is stateless, but every end user interaction leaves a set of small text and image files. Each directory keeps all daily transaction files. A process exists to manage file life cycle and periodically delete a directory.

The customer notices that as the customer base grows, the background deletion process backlog also grows. Which FlashBlade technology should be used to resolve this issue?

### Options:

---

- A- Enabling concurrent data access for NFS and SMB.
- B- Enabling concurrent data access for NFS and HTTP.
- C- Enabling fast-remove for NFS and SMB. \*\*\*
- D- Reducing resource utilization for FlashBlade garbage collection.

**Answer:**

---

C

## Question 10

---

**Question Type: MultipleChoice**

---

A developer of a business-critical application is concerned about system reliability when it comes to a IO resistance. An architect needs to explain the FlashBlade write mechanism and address three main concerns:

- Data location when FlashBlade acknowledge a write
- Number of created data copies before FlashBlade acknowledges a write
- Blade failure resilience

When does write acknowledgement happen?

**Options:**

---

**A-** When data is written onto Flash. \*\*\*

**B-** When data is written NvRAM on three different blades.

**C-** When data is written NvRAM on two different blades.

**D-** When data is written NvRAM on a super capacitor.

**Answer:**

---

A

## Question 11

---

**Question Type: MultipleChoice**

---

An HPC environment has the following:

- 100 physical hosts, each with a single 10GbE NIC, and a single NFS mount point to the FlashBlade.
- A 7x52TB FlashBlade, connected to the Top-of-Rack switches via eight 40GbE connections.

What is the maximum aggregate write throughput the customer should expect from the FlashBlade?

**Options:**

---

**A-** Approximately 7 GB/s

**B-** Approximately 4.2 GB/s

**C-** Approximately 4 GB/s

**D-** Approximately 2.1 GB/s \*\*\*

**Answer:**

---

D
